

How to Convert the Shaders from HDRP to URP

There is a quick solution to convert the shaders and it can take just few minutes. Please make sure to use 2020 versions or higher for this solution.

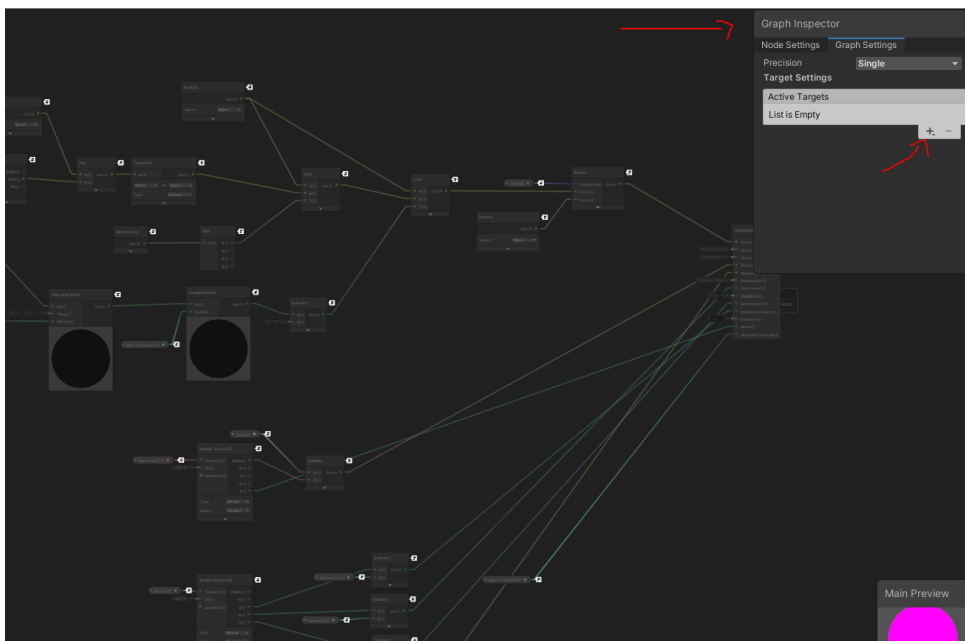

First, you need to locate the shaders in package, there is a folder named “*shader graph*” that contains the shaders.

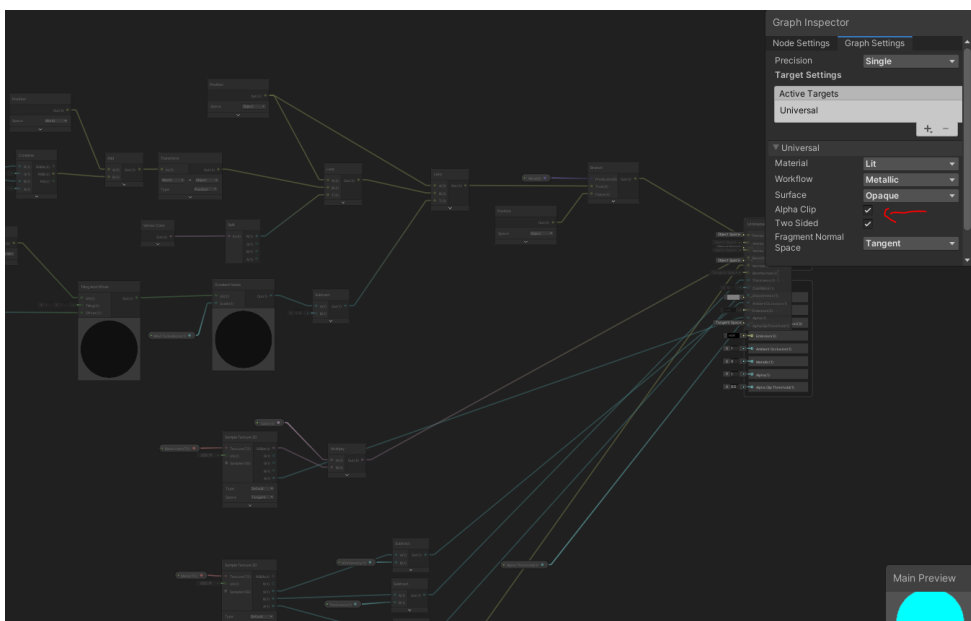

Double click on the Shader graph file and it will open the graph window. It's normal if the graph's nodes appear with this symbol: #

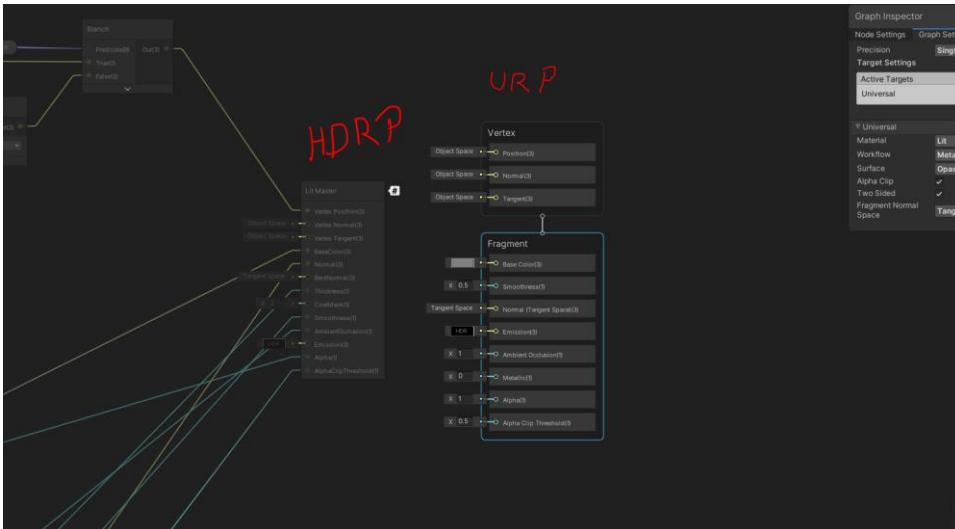

To fix that, you need to add an **“Active Target”** in the Graph Inspector, clicking on the Plus symbol and then **“Universal”**

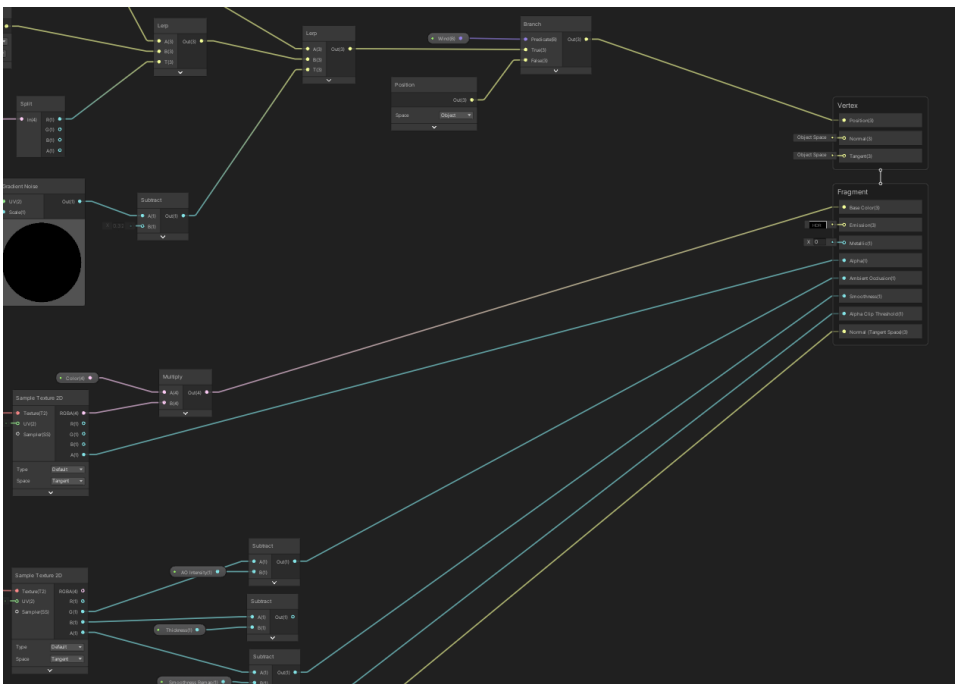

This will fix the issue and now all nodes from the graph where updated. Very quick! Also do not forget to check **“Alpha Clip”** and **“Double-sided”**. That's the way vegetation needs to be render.

At last, you just need to replace the **master node**, it's simple, you will not be able to use the Lit master from HDRP so just connect the outputs to the new **Universal Master node** (The Universal Master node will appear automatically when you add the **Active Target**)

The good news is that both Master nodes have the same names. The graph should look like this:

Delete the **HDRP lit master** node and then click on **Save Asset**.

This is the way that vegetation looks in URP after that:

Also, it conserves the Translucency effect and wind animation.

Most of the cases you will need to update 2 Graphs from the package (Basic Vegetation and Vegetation), It's not sure if you will be able to run the Demo scene property from package, because the post-processing and render setting are different from URP and HDRP, but you can use the vegetation (assets) without problems in URP scenes.

Note: Images from this document are for illustration purposes, the result will depend on the package content.

Enjoy!

Paul from SeedMesh.
